

UNDERGRADUATE INTERNSHIP OPPORTUNITIES

Global Environmental Change Research at **UCDAVIS**

Erwan Monier Research Group

Our group conducts research to inform decision-makers on challenges relating to global environmental change. Our research articulates around three dimensions:

- **climate change impacts**
- **climate change and extreme events**
- **human and Earth system interactions**

Examples of internship projects include:

- Analyze climate model output to identify how climate change will modify the frequency, magnitude and characteristics of extreme weather events in California and around the US
- Examine historical weather data to identify meteorological conditions associated with major wildfire events in California and other US regions

Let's work together to build a project you feel passionate about!!!
